#### How predictable is extinction?

Forecasting species survival at million-year timescales

Peter D Smits, Seth Finnegan

Department of Integrative Biology, University of California - Berkeley

## Foundational assertion of conservation paleobiology

By studying the past, we can better predict the future.

What are we predicting?

Extinction is hard to predict, but is important to conservation decisions.

#### Predicting extinction

➤ A taxon with a greater than average global geographic range is likely to survive for longer than a taxon with less than average global geographic range.

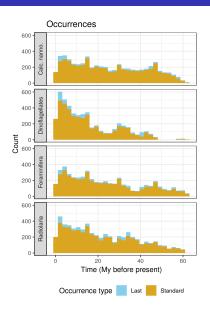

#### Predicting extinction

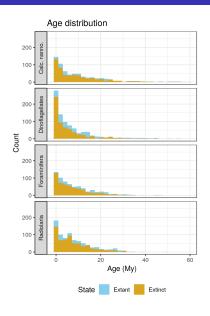

- ► A taxon with a greater than average global geographic range is likely to survive for longer than a taxon with less than average global geographic range.
- ► A taxon's global geographic range can change over time.

#### Predicting extinction

- ➤ A taxon with a greater than average global geographic range is likely to survive for longer than a taxon with less than average global geographic range.
- A taxon's global geographic range can change over time.
- What happens to extinction risk as a taxon changes geographic range? How is extinction risk impacted if that taxon's global geographic range has recently increased or decreased?

## Data being analyzed

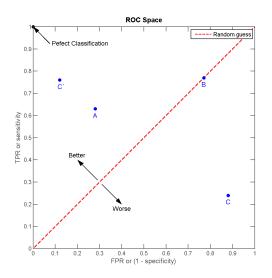

#### How we're analyzing the data

- Encoding the past
  - Change in geographic range between current observation and previous observation.
  - Average global temperature at time of previous observation (Mg/Ca isotope).
  - ▶ Age in millions of years at time of observation.
- Explore model adequacy using posterior predictive distribution.
- ► Estimate out-of-sample predictive performance using *k*-fold cross-validation.

# Measuring performance: Reciever Operating Characteristic

		Actual class	
		1	0
Predicted class	1	TRUE	FALSE
		POSITIVE	POSITIVE
	0	FALSE	TRUE
		NEGATIVE	NEGATIVE
